

Building strength through tai chi

[JANE E. BRODY](#) Originally published October 11, 2018 at 6:00 am

Don't get scared by its frequent description as an "ancient martial art." Tai chi moves are easy to learn and the activity has been credited with a wide variety of health benefits.

Watching a group of people doing tai chi, an exercise often called "meditation in motion," it may be hard to imagine that its slow, gentle, choreographed movements could actually make people stronger. Not only stronger mentally but stronger physically and healthier as well.

I certainly was surprised by its effects on strength, but good research — and there's been a fair amount of it by now — doesn't lie. If you're not ready or not able to tackle strength-training with weights, resistance bands or machines, tai chi may just be the activity that can help to increase your stamina and diminish your risk of injury that accompanies weak muscles and bones.

Don't get scared by its frequent description as an "ancient martial art." Tai chi (and a related exercise called qigong) does not resemble the strenuous, gravity-defying kung fu moves you may have seen in Jackie Chan films. Tai chi moves can be easily learned and executed by people of all ages and most states of health, even those in their 90s, in wheelchairs or bedridden.

It has been eight years since I last summarized the known benefits of this time-honored form of exercise, and it has since grown in popularity in venues like Y's, health clubs and community and senior centers. By now it is likely that millions more people have become good candidates for the help tai chi can provide to their well-being.

First, a reprise of what I previously wrote as to why most of us should

consider including tai chi into our routines for stronger bodies and healthier lives.

- It is a low-impact activity suitable for people of all ages and most states of health, including those who have long been sedentary or “hate” exercise.
- It is a gentle, relaxing activity that involves deep breathing but does not work up a sweat or leave you out of breath.
- It does not place undue stress on joints and muscles and therefore is unlikely to cause pain or injury.
- It requires no special equipment or outfits, only lightweight, comfortable clothing.
- Once proper technique is learned from a qualified instructor, it is a low-cost activity that can be practiced anywhere, anytime.

One more fact: Beneficial results from tai chi are often quickly realized. Significant improvements involving a host of different conditions can be achieved within 12 weeks of tai chi exercises done for an hour at a time twice a week.

Much of the research, which was reviewed in 2015 by researchers at Beijing University and Harvard Medical School, has focused on how tai chi has helped people with a variety of medical problems. It is summarized in a new book from Harvard Health Publications, “An Introduction to Tai Chi,” which includes the latest studies of healthy people whose mission was health preservation as well as people with conditions like high blood pressure, heart disease, diabetes, arthritis and osteoporosis.

Of the 507 studies included in the 2015 review, 94.1 percent found positive effects of tai chi. These included 192 studies involving only healthy

participants, 142 with the goal of health promotion or preservation and 50 seeking better balance or prevention of falls. This last benefit may be the most important of all, given that every 11 seconds an older adult is treated in the emergency room following a fall, and 1 in 5 falls results in a fracture, concussion or other serious injury.

For example, in an analysis of high-quality studies published last year in the *Journal of the American Geriatrics Society*, researchers at the University of Jaen in Spain reported that older adults who did one-hour tai chi sessions one to three times a week for 12 to 26 weeks were 43 percent less likely to fall and half as likely to incur a fall-related injury.

Tai chi provided superior benefits to other fall-reduction approaches like physical therapy, balance exercises, stretching, yoga or resistance training. Tai chi, in effect, combines the benefits of most of these: It strengthens the lower body, improves posture, promotes flexibility, increases a person's awareness of where the body is in space and improves one's ability to navigate obstacles while walking.

Furthermore, if you should trip, tai chi can enhance your ability to catch yourself before you fall. It has also been shown to counter the fear of falling, which discourages people from being physically active and further increases their likelihood of falling and being injured.

Even if you do fall, tai chi, as a weight-bearing but low-stress exercise, can reduce your chances of breaking a bone. Four well-designed clinical trials showed that tai chi has positive effects on bone health. For example, in a yearlong study in Hong Kong of 132 women past menopause, those practicing tai chi experienced significantly less bone loss and fewer fractures than those who remained sedentary.

Tai chi can also be an entry point for people who may have fallen off the

exercise wagon but want to get back to doing more vigorous and often more enjoyable physical activities like swimming and hiking, or biking and walking to and from errands instead of relying on vehicles that pollute the air and clog the roads.

Guidelines from the American College of Sports Medicine and the American Heart Association recommend that sedentary older adults begin with balance, flexibility and strength training exercises before launching into moderate to vigorous physical activity.

Tai chi is ideal for getting people ready for more demanding action.

And, in the process of getting your body in shape with tai chi, you're likely to improve your mental state. In a New Zealand study of college students, tai chi was shown to counter depression, anxiety and stress. It also enhances an important quality called self-efficacy — confidence in one's ability to perform various activities and overcome obstacles to doing so.
